### 4.4. Proof using 1-consistency.

In this section we show that Propositions $A, B$ can be proved in $A C A^{\prime}+1$-Con (SMAH). Here $1-C o n(T)$ is the 1 -consistency of $T$, which asserts that "every $\Sigma^{0}{ }_{1}$ sentence provable in $T$ is true". 1-Con(T) is also equivalent to "every $\Pi_{2}^{0}$ sentence provable in $T$ is true".

By Lemma 4.2.1, Proposition B implies Proposition A in $\mathrm{RCA}_{0}$. Hence it suffices to show that Proposition B can be proved in $A^{\prime} A^{\prime}+1$-Con (SMAH).

DEFINITION 4.4.1. We write ELG (p,b) for the set of all $f \in$ ELG of arity p satisfying the following conditions. For all $\mathrm{x} \in \mathrm{N}^{\mathrm{p}}$,
i. if $|x|>b$ then $(1+1 / b)|x| \leq f(x) \leq b|x|$. ii. if $|x| \leq b$ then $f(x) \leq b^{2}$.

Note that from Definition 2.1, $f \in E L G$ if and only if there exist positive integers $p, b$ such that $f \in \operatorname{ELG}(p, b)$. Also note that each ELG ( $\mathrm{p}, \mathrm{b}$ ) forms a compact subspace of the Baire space of functions from $N^{k}$ into $N$.

DEFINITION 4.4.2. Let $p, q, b \geq 1$. A $p, q, b-s t r u c t u r e ~ i s ~ a ~$ system of the form

$$
\mathrm{M}^{\star}=\left(\mathrm{N}^{*}, 0^{*}, 1^{*},<^{\star},+^{*}, \mathrm{f}^{\star}, \mathrm{g}^{\star}, \mathrm{C}_{0}{ }^{\star}, \ldots\right)
$$

such that

1. $\mathrm{N}^{*}$ is countable. For specificity, we can assume that $\mathrm{N}^{*}$ is N.
2. ( $\left.\mathrm{N}^{*}, 0^{*}, 1^{*},<^{*},+^{*}\right)$ is a discretely ordered commutative semigroup (see definition below).
3. $+^{*}: N^{*^{2}} \rightarrow N^{\star}, f^{\star}: N^{* p} \rightarrow N^{*}, g^{*}: N^{* q} \rightarrow N^{\star}$.
4. f* obeys the above two inequalities for membership in ELG(p,b), internally in $M^{*}$.
5. g* obeys the above two inequalities for membership in ELG ( $\mathrm{a}, \mathrm{b}$ ), internally in $\mathrm{M}^{*}$.
6. Let $i \geq 0$. The sum of any finite number of copies of $c_{i}{ }^{*}$ is < $\mathrm{C}_{\mathrm{i}+1}{ }^{*}$.
7. The c*'s form a strictly increasing set of indiscernibles for the atomic sentences of $\mathrm{M}^{*}$.

Note that the conditions under clauses 4-7 are all universal sentences.

Note that we do not require every element of $\mathrm{N}^{*}$ to be the value of a closed term.

DEFINITION 4.4.3. A discretely ordered commutative semigroup is a system ( $G, 0,1,<,+$ ) such that
i. < is a linear ordering of $G$. ii. 0,1 are the first two elements of $G$.
iii. $x+0=x$.
iv. $x+y=y+x$.
v. $(x+y)+z=x+(y+z)$.
vi. $x<y \rightarrow x+z<y+z$.
vii. $x+1$ is the immediate successor of $x$.

Note that the cancellation law

$$
x+z=y+z \rightarrow x=y
$$

holds in any discretely ordered commutative semigroup (in this sense), since assuming $x+z=y+z$, the cases $x<y$ and $\mathrm{y}<\mathrm{x}$ are impossible.
 inaccessibility condition: any closed term whose value is $C_{n}{ }^{*}$ is a sum consisting of $C_{n}{ }^{*}$ and zero or more $0{ }^{* \prime}$ s. To see this, write $c_{n}{ }^{*}=t$, and write $t$ as a sum, $t=s_{1}+\ldots+$ $s_{k}, k \geq 1$, where each $s_{i}$ is either a constant or starts with f or $g$. By 7, $\mathrm{C}_{\mathrm{n}}$ * is infinite, and so all $\mathrm{si}_{\mathrm{i}}$ that begin with f or $g$ must have immediate subterms $<c_{n} *$ (using 4,5). Hence all $s_{i}$ that begin with $f$ or $g$ must be $<c_{n}$ * (using 4,5,6). Hence all $s_{i}$ are either $<\mathrm{c}_{\mathrm{n}} *$ or are a constant. If no $\mathrm{s}_{\mathrm{i}}$ is $c_{i} *$ then all $s_{i}$ are $<c_{n} *$, violating 6. Hence some $s_{i}$ is $c_{n}{ }^{*}$. By 2, the remaining $s_{i}$ must be 0 .

We can follow the development of section 4.2 starting right after the proof of Lemma 4.2.7. In this rerun, we do not fix $f \in \operatorname{ELG}(p, b)$, and $g \in \operatorname{ELG}(q, b)$.

Instead we fix $p, q, b, n \geq 1$, a strongly $p^{n-1}$-Mahlo cardinal $\kappa$, and a $p, q, b-s t r u c t u r e ~ M^{*}$, where every element of $N^{*}$ is the value of a closed term in $M^{*}$. Note that we must have $\mathrm{b} \geq 2$.

As in the development of section 4.2 after the proof of Lemma 4.2.7, we extend $M^{*}$ to the structure

$$
M^{* *}=\left(N^{* *},<* *, 0 * *, 1 * *,+* *, f * *, g^{* *}, C_{0}{ }^{* *}, \ldots, c_{a}^{* *}, \ldots\right),
$$

$$
\alpha<\kappa
$$

We follow this prior development through the first line of the proof of Theorem 4.2.26.

Thus we have $r \geq 1, E \subseteq S \subseteq \kappa$ of order type $\omega$, and sets $\mathrm{E}[1] \subseteq \ldots \subseteq \mathrm{E}[\mathrm{n}] \subseteq \mathrm{M}^{* *}[\mathrm{~S}, \mathrm{r}]$ such that
i. $\left.\mathrm{E}[1]=\mathrm{C}_{\alpha}{ }^{* *}: \alpha \in \mathrm{E}\right\}$.
ii. For all $1 \leq i<n, f * * E[i] \subseteq E[i+1]$ U. g**E[i+1]. $^{\text {( }}$

This construction of $E \subseteq S \subseteq \kappa$ of order type $\omega$ uses that $\kappa$ is strongly $\mathrm{p}^{\mathrm{n}-1}$-Mahlo.

In the proof of Theorem 4.2.26, we continued by transferring this situation back into $N$ via an $S, r(p+q)-$ embedding $T$ from $M^{* *}$ into $M$, thus establishing Proposition $B$ with the sets $T E[1] \subseteq \ldots \subseteq T E[n]$.

Here we want to merely transfer this situation back into M* via an $S, r(p+q)$-embedding from $M^{* *}$ into $M^{*}$, and then establish uniformities. By Lemma 4.2.12, we use the unique isomorphism from $M^{* *}\left\langle S>\right.$ onto $M^{*}$ which maps $\left\{C_{\alpha}{ }^{* *}: \alpha \in S\right\}$ onto $\left\{C_{j}{ }^{*}: ~ j \geq 0\right\}$.

As in section 4.2, for $r \geq 1$, we write $M^{*}[r]$ for the set of all values of closed terms of length $\leq r$ in $M^{*}$.

Thus we obtain $r \geq 1$ and infinite sets $D[1] \subseteq \ldots \subseteq D[n] \subseteq$ $M^{*}[r]$ such that
iii. $D[1] \subseteq\left\{C_{j}^{*}: ~ j \geq 0\right\}$.
iv. For all $1 \leq i<n, f * D[i] \subseteq D[i+1] \cup . g^{*} D[i+1]$.

We summarize this modified development as follows.
LEMMA 4.4.1. Let $\mathrm{p}, \mathrm{q}, \mathrm{b}, \mathrm{n} \geq 1$. The following is provable in SMAH. Let $M^{*}=\left(N^{*}, 0^{*}, 1^{*},<^{*},+^{*}, f^{*}, g^{*}, C_{0}^{*}, \ldots\right)$ be a $p, q, b-$ structure. There exist $r \geq 1$ and infinite sets $D[1] \subseteq \ldots \subseteq$ $D[n] \subseteq M^{*}[r]$ such that $D[1] \subseteq\left\{C_{j}^{*}: j \geq 0\right\}$, and for all $1 \leq$ i < n, f*D[i] $\subseteq$ D[i+1] U. g*D[i+1]. Furthermore, this entire Lemma, starting with "Let p...", is provable in $R C A_{0}$.

Proof: Let $\mathrm{p}, \mathrm{q}, \mathrm{b}, \mathrm{n}, \mathrm{M}^{*}$ be as given. Proceed as discussed above. One of the important points is that we only need $M^{*}$ $=$ ( $\left.N^{*}, 0 *, 1 *,<*,+*\right)$ to obey the axioms for a discretely ordered commutative group. QED

By using Lemma 4.4.1, we will no longer need to refer back to section 4.2.

We can obviously view clauses 3-7 in the definition of
 standard integer.

We now introduce the notion of $p, q, b ; r$-structure, which is a level $r$ approximation to a p,q,b-structure.

DEFINITION 4.4.4. Let $p, q, b, r \geq 1 . A \operatorname{p,q}, r$-structure is a system of the form

$$
M^{*}=\left(N^{*}, 0^{*}, 1^{*},<*,+^{*}, f^{*}, g^{*}, C_{0}^{*}, \ldots\right)
$$

such that the following holds.
a. Clauses 1,2,3 in the definition of $p, q, b-s t r u c t u r e$, without change.
b. All instantiations of the universal sentences under clauses 4-7, by closed terms of length $\leq r$. Here length counts the total number of occurrences of constant and function symbols that appear.

In particular, we are using the following specialization of clause 7 in the definition of $p, q, b-s t r u c t u r e:$

7'. The c*'s form a strictly increasing set of indiscernibles for the atomic sentences of $\mathrm{M}^{*}$ whose terms are of length $\leq r$.

Again, we do not require that every element of $\mathrm{N}^{*}$ be the value of a closed term.

DEFINITION 4.4.5. A p, q,b;r;n-special structure is a p, q,b;r-structure $M^{*}$ where there exist infinite $\mathrm{D}_{1} \subseteq \ldots$... $\subseteq$ $D_{n} \subseteq M^{*}[r /(p+q)]$ such that i. For all $1 \leq i<n, f * D_{i} \subseteq D_{i+1} \cup$. $g^{*} D_{i+1}$. ii. $D_{1} \subseteq\left\{C_{j}: * j \geq 0\right\}$.

We use $\mathrm{M}^{*}[r /(\mathrm{p}+\mathrm{q})]$ instead of $\mathrm{M}^{*}[r]$ since in clause i, we are applying f*,g* to p,q, terms, respectively, and want all relevant terms to have length at most r.

DEFINITION 4.4.6. The r-type of a $p, q, b ; r$-structure $M^{*}$ is the set of all closed atomic sentences, whose terms have
length $\leq r$, involving only the constants $0,1, c_{0}, \ldots, c_{2 r}$, which hold in $\mathrm{M}^{*}$. Thus r-types are finite sets.

DEFINITION 4.4.7. A p,q,b;r-type is the r-type of a
 of a p,q,b;r;n-special structure.

LEMMA 4.4.2. Let $\mathrm{M}^{*}$ be a $\mathrm{p}, \mathrm{q}, \mathrm{b}$;r-structure. Then $\mathrm{M}^{*}$ is a $p, q, b ; r ; n-s p e c i a l$ structure if and only if the r-type of $M^{*}$ is a $p, q, b ; r ; n$-special type.

Proof: Let $\mathrm{M}^{*}$ be a $\mathrm{p}, \mathrm{q}, \mathrm{b} ; \mathrm{r}-\mathrm{structure} .\mathrm{First} \mathrm{suppose} \mathrm{that} \mathrm{M}^{*}$ is a p,q,b;r;n-special structure. Then by definition, the r-type of $M^{*}$ is a $p, q, b ; r ; n-s p e c i a l ~ t y p e . ~$

Conversely, suppose the r-type $\tau$ of $M^{*}$ is a $p, q, b ; r ; n-$ special type. Let $M^{*}$ ' be a $p, q, b ; r ; n-s p e c i a l$ structure of r-type $\tau$.

Let $\mathrm{D}_{1} \subseteq \ldots \subseteq \mathrm{D}_{\mathrm{n}} \subseteq \mathrm{M}^{\star \prime}[\mathrm{r} /(\mathrm{p}+\mathrm{q})]$ be infinite, where i. For all $1 \leq i<n, f * D_{i} \subseteq D_{i+1} \cup$. $g^{*} D_{i+1}$. ii. $D_{1} \subseteq\left\{C_{j} *: j \geq 0\right\}$.

We can obviously come up with an infinite list of atomic sentences whose terms are of length $\leq r$, whose truth in $M^{* \prime}$
 include the atomic sentences with terms of length $\leq r$ that justify that $M^{*}$ ' is a $p, q, b ; r-s t r u c t u r e, ~ a n d ~ t h e ~ a t o m i c ~$ sentences with terms of length $\leq r$ that justify the special clauses i,ii just above. This uses the fact that the lengths of $f\left(s_{1}, \ldots, s_{p}\right)$, $g\left(t_{1}, \ldots, t_{q}\right)$ are $\leq r$ provided the lengths of $s_{1}, \ldots, s_{p}, t_{1}, \ldots, t_{q}$ are $\leq r /(p+q)$. But since $M^{*}$ and $\mathrm{M}^{*}$ ' have the same r-type, they agree on all such statements. Hence $M^{*}$ is a $p, q, b ; r ; n-s p e c i a l ~ s t r u c t u r e . ~ Q E D ~$

We can view the following as a uniform version of Lemma 4.4.1.

LEMMA 4.4.3. Let $\mathrm{p}, \mathrm{q}, \mathrm{b}, \mathrm{n} \geq 1$. The following is provable in SMAH. There exist $r \geq 1$ such that every $p, q, b ; r-s t r u c t u r e ~ i s$ p,q,b;r;n-special. Furthermore, this entire Lemma, starting with "Let p..." is provable in $R C A_{0}$.

Proof: Fix p,q,b,n $\geq 1$. We now argue in SMAH. Suppose this is false. Let $T$ be the following theory in the language of $p, q, b-s t r u c t u r e s$.
i. Let $r \geq 1$. Assert the axioms for being a $p, q, b ; r-$ structure.
 $\tau$ is not the r-type of the $p, q, b ; r$-structure.

We claim that every finite subset of $T$ is satisfiable. To see this, let $r$ be an upper bound on the r's used in the finite subset. By hypothesis, there exists a p,q,b;rstructure $M^{*}$ that is not a $p, q, b ; r ; n-s p e c i a l ~ s t r u c t u r e . ~ F i x ~$ r, M*.

We claim that $\mathrm{M}^{*}$ satisfies the finite subset of $T$. Let $\tau$ be the r-type of the $p, q, b ; r$-structure $M^{*}$.

Obviously $\mathrm{M}^{*}$ satisfies all instances of i) for $r^{\prime} \leq r$. Now let $1 \leq r^{\prime} \leq r$ and $\tau^{\prime}$ be a $p, q, b ; r^{\prime} ; n$-special type. Suppose that $\tau^{\prime}$ is the correct $r^{\prime}$-type of $M^{*}$. I.e., $M^{*}$ has $r^{\prime}$-type $\tau^{\prime}$. By Lemma 4.4.2, $\mathrm{M}^{*}$ is a $\mathrm{p}, \mathrm{q}, \mathrm{b} ; \mathrm{r}^{\prime} ; \mathrm{n}-\mathrm{special}$ structure. Since $M^{*}$ is a $p, q, b ; r-s t r u c t u r e, ~ M^{*}$ is a $p, q, b ; r ; n-s p e c i a l$ structure. This is a contradiction.

By the compactness theorem, $T$ is satisfiable. Let $\mathrm{M}^{*}$ satisfy $T$. By Lemma 4.4.1, let $r$ be such that $M^{*}$ is
 p,q,b;r;n-special type. By axioms ii) above, $\tau$ is not the rtype of $\mathrm{M}^{*}$. This is a contradiction. QED

LEMMA 4.4.4. There is a presentation of a primitive recursive function $Q(p, q, b, r, \tau)$ such that the following is provable in $R C A_{0} . Q(p, q, b, r, \tau)=1$ if and only if $\tau$ is a p,q,b;r-type (as a Gödel number).

Proof: We give the following necessary and sufficient finitary condition for $\tau$ to be a $p, q, b ; r-t y p e$.

1. $\tau$ is a set of atomic sentences in $0,1,<,+, f, g, C_{0}, \ldots, c_{2 r}$ whose terms have length $\leq r$, involving only the constants $0,1, \mathrm{C}_{0}, \ldots, \mathrm{C}_{2 \mathrm{r}}$.
2. There is a system $\mathrm{V}^{\star}=$
(D,E,O*,1*, <*, +*, f*, $\mathrm{g}^{*}, \mathrm{C}_{0}{ }^{*}, \ldots, \mathrm{C}_{2 \mathrm{r}}{ }^{*}$ ) which obeys the following conditions.
i. D,E have cardinality at least 1 and at most some specific iterated exponential in $p, q, r$.
ii. $0 *, 1 * \in D$.
iii. +*: ${ }^{2} \rightarrow$ E.
iv. f*: $\mathrm{D}^{\mathrm{p}} \rightarrow \mathrm{E}$.
V. $g^{*}: D^{q} \rightarrow E$.
vi. D is the set of values of the closed terms of length $\leq$ r.
vii. E is D union the values of $+\star$, f*, $\mathrm{g}^{*}$.
vii. All axioms in clause b in the definition of p, q, b;rstructure hold in $V^{*}$.
viii. All sentences in $\tau$ hold in $V *$.
ix. All atomic sentences in $0,1,<,+, f, g, c_{0}, \ldots, c_{2 r}$ outside $\tau$, with terms of length $\leq r, f a i l i n ~ V *$.

This condition is necessary because such a structure $V$ * can be obtained from any p, q,b;r-structure $M^{*}$ of r-type $\tau$ by taking $D$ to be the set of values of closed terms in $M^{\star}$ of length $\leq r$, restricting $M^{*}$ in the obvious way. The atomic sentences in $0,1,<,+, f, g, C_{0}, \ldots, C_{2 r}$ that hold in $V *$ are the same as those that hold in $M^{*}$, which are the elements of $\boldsymbol{\tau}$.

For the other direction, let $\tau, V \star$ be given as above. Using the indiscernibility in ix, we can canonically stretch $V$ * to

$$
\mathrm{W}^{\star}=\left(\mathrm{D}^{\prime}, \mathrm{E}^{\prime}, \mathrm{O}^{\star}, 1^{\star},<^{\star \prime},+^{\star}, \mathrm{f}^{\prime \prime}, \mathrm{g}^{\star \prime}, \mathrm{C}_{0} \star^{\prime}, \mathrm{C}_{1} \star^{\prime}, \ldots\right)
$$

which obviously obeys clause 1 and clauses 2i-2ix above, modified to incorporate all constant symbols co, $c_{1}, \ldots$. We now have all of the conditions we need for being a $p, q, b ; r-$ structure except that we only have $D^{\prime} \subseteq E^{\prime}$. However, this is easily remedied without affecting the properties of $W^{*}$ by taking the domain to be $\mathrm{E}^{\prime}$, and extending $\mathbf{~}^{* * \prime}$, f*', $\mathrm{g}^{* \prime}$ arbitrarily to the tuples from $E^{\prime}$ that are not tuples from $D^{\prime}$, into $E^{\prime}$. This resulting modification of $W^{*}$ is a $p, q, b, r-s t r u c t u r e ~ w i t h ~ r-t y p e ~ \tau . ~ Q E D ~$

Let $\tau$ be a $p, q, b ; r-t y p e . ~ W e ~ w a n t ~ t o ~ e x p r e s s ~$

1) $\tau$ is a $p, q, b ; r ; n-s p e c i a l ~ t y p e ~$
as a sentence $\lambda\left(k, n, p+q+2, R_{1}, \ldots, R_{n-1}\right)$ of section 4.3 , and then apply Theorem 4.3.8.

Recall that 1$)$ is equivalent to the condition
2) there exists a $p, q, b ; r-s t r u c t u r e ~ M * ~ o f ~ r-t y p e ~ t ~ a n d ~$ infinite sets $\mathrm{D}_{1} \subseteq \ldots \subseteq \mathrm{D}_{\mathrm{n}} \subseteq \mathrm{M}^{\star}[r /(\mathrm{p}+\mathrm{q})]$ such that i. For all $1 \leq i<n, f * D_{i} \subseteq D_{i+1} \cup . g^{*} D_{i+1}$. ii. $D_{1} \subseteq\left\{C_{j} *: j \geq 0\right\}$.

We now put this in a more syntactic form.
DEFINITION 4.4.8. A p, q, r-term is a closed term in $0,1,+, f, g$ and constants $C_{0}, C_{1}, \ldots$ of length at most $r$.

We identify $M^{*}[r]$ with the set of all p,q,r-terms. Of course, a given element of $M *[r]$ may be the value of many $p, q, r$-terms.

DEFINITION 4.4.9. We let $\boldsymbol{\tau}^{*}$ be the set of all atomic sentences obtained from elements of $\tau$ by replacing c's by $c^{\prime}$ s in an order preserving way.
3) there exist infinite sets $T_{1} \subseteq \ldots \subseteq T_{n}$ of $p, q, r /(p+q)-$ terms such that
i. For any two distinct elements $t, t^{\prime}$ of $T_{n}, t=t^{\prime} \notin \tau^{*}$. ii. Every $t \in T_{1}$ is some $c_{k}$.
iii. Let $1 \leq i<n$ and $t_{1}, \ldots, t_{p} \in T_{i}$. Then there exists $t \in$ $T_{i+1}$ such that $f\left(t_{1}, \ldots, t_{p}\right)=t \in \tau^{\star}$, or there exist $t_{1}{ }^{\prime}, \ldots, t_{q}^{\prime} \in T_{i+1}$ such that $f\left(t_{1}, \ldots, t_{p}\right)=g\left(t_{1}{ }^{\prime}, \ldots, t_{q}^{\prime}\right) \in$ $\tau^{*}$.
iv. Let $t, t_{1}, \ldots, t_{q} \in T_{n}$. Then $g\left(t_{1}, \ldots, t_{q}\right)=t \notin \tau^{\star}$.
v. For all $k \geq 0$ and $t_{1}, \ldots, t_{p} \in T_{n}, f\left(t_{1}, \ldots, t_{p}\right)=c_{k} \notin \tau^{*}$.

LEMMA 4.4.5. The following is provable in $\mathrm{RCA}_{0}$. Let $p, q, b, n, r \geq 1$ and $\tau$ be a $p, q, b ; r-t y p e$. Then conditions 1)-3) are equivalent.

Proof: Let $\tau$ be a p,q,b;r-type. It is obvious that 1),2) are equivalent. So assume 2) holds. We derive 3). Let M* be a $\mathrm{p}, \mathrm{q}, \mathrm{b}$; r-structure of r -type $\tau$, and $\mathrm{D}_{1} \subseteq \ldots \subseteq \mathrm{D}_{\mathrm{n}} \subseteq$ $M^{*}[r /(p+q)]$ be infinite sets such that
i. For all $1 \leq i<n, f D_{i} \subseteq D_{i+1} \cup$. $g D_{i+1}$.
ii. $D_{1} \subseteq\left\{C_{j}{ }^{*}: j \geq 1\right\}$.

For each $x \in D_{n}, ~ p i c k ~ a ~ p, q, r /(p+q)$-term $x \#$ of least possible length whose value in $M^{*}$ is $x$. If $x$ is some $C_{i}{ }^{*}$ then make sure that $x \#$ is $C_{i}$. Set $T_{i}=\left\{x \#: x \in D_{i}\right\}$.

Since $\mathrm{D}_{1} \subseteq \ldots \subseteq \mathrm{D}_{\mathrm{n}}$, clearly $\mathrm{T}_{1} \subseteq \ldots \subseteq \mathrm{~T}_{\mathrm{n}}$. Since every $\mathrm{x} \in$ $\mathrm{D}_{\mathrm{n}}$ lies in $\mathrm{M}^{*}[\mathrm{r} /(\mathrm{p}+\mathrm{q})]$, clearly every $\mathrm{x} \# \in \mathrm{~T}_{\mathrm{n}}$ has length $\leq$ $r /(p+q)$.

Let $t, t^{\prime} \in T_{n}$ be distinct. Write $t=x \#, t^{\prime}=y \#$. Then $x \# \neq$ $y \#, ~ a n d$ so $t=t^{\prime}$ is false. Hence $t=t^{\prime} \notin \tau^{\star}$. Let $t \in T_{1}$.

Write $t=x \#, x \in D_{1}$. Then $x$ is some $c_{k}{ }^{*}$. Therefore $x \#=c_{k}$. This establishes 3i and 3ii.

To verify 3iii, let $1 \leq i<n$ and $x_{1} \#, \ldots, x_{p} \# \in T_{i}$. Then $x_{1}, \ldots, x_{p} \in D_{i}$. Hence $f *\left(x_{1}, \ldots, x_{p}\right) \in f^{*} D_{i} \subseteq D_{i+1} \cup . g^{*} D_{i+1}$.
case 1. $f *\left(x_{1}, \ldots, x_{p}\right) \in D_{i+1}$. Let the $p, q, r /(p+q)-t e r m ~ t \in$ $\mathrm{T}_{\mathrm{i}+1}$ have the value $\mathrm{f}^{*}\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{p}}\right)$ in $\mathrm{M}^{*}$. Then $\mathrm{f}\left(\mathrm{x}_{1} \#, \ldots, \mathrm{x}_{\mathrm{p}} \#\right)=$ $t$ holds in $M^{*}$, and both terms in this equation have length $\leq$ $r$. Hence $f\left(x_{1} *, \ldots, x_{p}{ }^{*}\right)=t \in \tau^{\star}$.
case 2. $f^{*}\left(x_{1}, \ldots, x_{p}\right) \in g D_{i+1}$. Let $f^{*}\left(x_{1}, \ldots, x_{p}\right)=$ $g^{*}\left(y_{1}, \ldots, y_{q}\right)$, where $y_{1}, \ldots, y_{q} \in D_{i+1}$. Then $y_{1} \#, \ldots, y_{q} \# \in T_{i+1}$. Also $f\left(x_{1} *, \ldots, x_{p}{ }^{*}\right)=g\left(y_{1} *, \ldots, y_{q}^{*}\right)$ holds in $M^{*}$, and both terms in this equation have length $\leq r$. Hence $f\left(x_{1} *, \ldots, x_{p} *\right)$ $=g\left(y_{1}{ }^{*}, \ldots, Y_{q}{ }^{*}\right) \in \tau^{*}$.

To verify 3iv, let $x \#, x_{1} \#, . . ., x_{q} \# \in T_{n}$. Then $g\left(x_{1} \#, \ldots, x_{q} \#\right)=$ $x \# \notin \tau^{\star}$ because $g^{*}\left(x_{1}, \ldots, x_{q}\right) \neq x$ in $M^{\star}$.

To verify $3 v$, let $k \geq 0$ and $x_{1} \#, \ldots, x_{p} \# \in T_{n}$. Then
$\mathrm{f}\left(\mathrm{x}_{1} \#, \ldots, \mathrm{x}_{\mathrm{p}} \#\right)=\mathrm{C}_{\mathrm{k}} \notin \tau^{\star}$ because $\mathrm{f}^{\star}\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{p}}\right) \neq \mathrm{C}_{\mathrm{k}}{ }^{\star}$ in $\mathrm{M}^{\star}$.
Now assume that 3) holds. We establish 2). Let $\mathrm{T}_{1} \subseteq \ldots \subseteq \mathrm{~T}_{\mathrm{n}}$ be infinite sets of $p, q, r /(p+q)-t e r m s$ such that
i. For any two distinct elements $t, t^{\prime}$ of $T_{n}, t=t^{\prime} \notin \tau^{*}$. ii. For all $t \in T_{1}$ there exists $k \geq 0$ such that $t$ is $C_{k}$. iii. Let $1 \leq i<n$ and $t_{1}, \ldots, t_{p} \in T_{i}$. Then there exists $t \in$ $T_{i+1}$ such that $f\left(t_{1}, \ldots, t_{p}\right)=t \in T_{i+1}$, or there exist $t_{1}{ }^{\prime}, \ldots, t_{q}{ }^{\prime} \in T_{i+1}$ such that $f\left(t_{1}, \ldots, t_{p}\right)=g\left(t_{1}{ }^{\prime}, \ldots, t_{q}{ }^{\prime}\right) \in$ $\tau^{\star}$.
iv. Let $t, t_{1}, \ldots, t_{q} \in T_{n}$. Then $g\left(t_{1}, \ldots, t_{q}\right)=t \notin \tau^{*}$.
v. For all $k \geq 0$ and $t_{1}, \ldots, t_{p} \in T_{n}, f\left(t_{1}, \ldots, t_{p}\right)=c_{k} \notin \tau^{*}$.

Let $M^{*}$ be any $p, q, b ; r$-structure of $r$-type $\tau$. For each $1 \leq i$ $\leq n$, let $D_{i}$ be the set of values of terms in $T_{i}$. Then $D_{1} \subseteq$ $\ldots \subseteq D_{n} \subseteq M^{\star}[r /(p+q)]$.

Let $1 \leq i<n$ and $x \in f * D_{i}$. We claim that $x \in D_{i+1} \cup g^{*} D_{i+1}$.
To see this, write $x=f *\left(x_{1}, \ldots, x_{p}\right), x_{1}, \ldots, x_{p} \in D_{i}$, and let $t_{1}, \ldots, t_{p} \in T_{i}$ have values $x_{1}, \ldots, x_{p}, r e s p e c t i v e l y$. By 3iii, let $t \in T_{i+1}$, where $f\left(t_{1}, \ldots, t_{p}\right)=t \in \tau^{*}$, or there exists $t_{1}{ }^{\prime}, \ldots, t_{q}^{\prime} \in T_{i+1}$ such that $f\left(t_{1}, \ldots, t_{p}\right)=g\left(t_{1}{ }^{\prime}, \ldots, t_{q}^{\prime}\right) \in$ $\tau^{\star}$.
case 1. $f\left(t_{1}, \ldots, t_{p}\right)=t \in \tau^{*}$. Then $f *\left(x_{1}, \ldots, x_{p}\right)=x \in D_{i+1}$.
case 2. Let $t_{1}{ }^{\prime}, \ldots, t_{q}^{\prime} \in T_{i+1}$, where $f\left(t_{1}, \ldots, t_{p}\right)=$ $g\left(t_{1}{ }^{\prime}, \ldots, t_{q}{ }^{\prime}\right) \in \tau^{\star}$. Let the values of $t_{1}{ }^{\prime}, \ldots, t_{q}{ }^{\prime}$ be $y_{1}, \ldots, y_{q} \in D_{i+1}$, respectively. Then $f^{*}\left(x_{1}, \ldots, x_{p}\right)=$ $\mathrm{g}^{\star}\left(\mathrm{y}_{1}, \ldots, \mathrm{Y}_{q}\right)$.

Now suppose $x \in D_{i+1} \cap \mathrm{gD}_{\mathrm{i}+1}$. Let x be the value of $t \in T_{i+1}$, and write $x=g\left(y_{1}, \ldots, y_{q}\right), y_{1}, \ldots, y_{q} \in D_{i+1}$. Let $t_{1}, \ldots, t_{q} \in$ $T_{i+1}$ have values y1,..., yq, respectively. By 3iv, g(t.,.., $t_{q}$ ) $=t \notin \tau^{*}$. Since both terms in this equation have length $\leq r$, we see that $g\left(t_{1}, \ldots, t_{q}\right)=t$ is false in $M^{*}$. Hence $g^{*}\left(y_{1}, \ldots, y_{q}\right) \neq x$. This is a contradiction.

Finally, let $x \in D_{1}$. Then $x$ is the value of a term $t \in T_{1}$. By 3ii, $t$ is some $c_{k}$. Hence $x$ is some $c_{k}{ }^{*}$. QED

We can conveniently represent the $p, q, r-t e r m s$ as elements of $\mathrm{N}^{\mathrm{k}}$ in the following way. This integer k will be set below.

DEFINITION 4.4.10. Two p,q,r-terms have the same shape if and only if the second can be obtained from the first by replacing c's by c's, where we do not require that equal $c^{\prime} s$ be replaced by equal c's.

Let $e$ be the number of shapes of the $p, q, r$-terms.
We represent the $p, q, r-t e r m ~ \sigma$ as follows. Let the shape of $\sigma$ be $1 \leq i \leq e$. Here the shapes have been arbitrarily indexed without repetition, by $1 \leq i \leq e$.

DEFINITION 4.4.9. The representations of $\sigma$ are obtained as follows. First write down a sequence of e elements of $N$, where exactly i of these elements are the same as the first of these elements. Follow this by the sequence of subscripts of the c's that appear from left to right. If this sequence of $c^{\prime} s$ is of length $<r$ then fill it out to length $r$ by repeating the last argument. This results in a representation of $\sigma$ as an element of $\mathrm{N}^{\mathrm{e+r}}$. Obviously, $\sigma$ will have infinitely many representations.

Set $k=e+r$. We will use the above representation of $p, q, r-$ terms to write 3) in the form of a sentence $\lambda\left(k, n, p+q+2, R_{1}, \ldots, R_{n-1}\right)$, as in section 4.3.
4) There exist infinite sets $\mathrm{B}_{1} \subseteq \ldots \subseteq \mathrm{~B}_{\mathrm{n}} \subseteq \mathrm{N}^{\mathrm{k}}$ of $p, q, r /(p+q)$-representations such that
a. Distinct elements of $B_{n}$ represent distinct $p, q, r /(p+q)-$ terms.
b. For each $1 \leq i \leq n$, let $T_{i}$ be the $p, q, r /(p+q)$-terms represented by the elements of $B_{i}$. Then $T_{1}, \ldots, T_{n}$ obeys 3) above.

Note the use of $\boldsymbol{\tau}^{\star}$ in 3). We represent elements of $\tau^{*}$ as a p, q,r-representation followed by two equal elements of N (indicating <), or followed by two unequal elements of N (indicating =), followed by a $p, q, r$-representation. Keep in mind that the lengths of $p, q, r-r e p r e s e n t a t i o n s ~ a r e ~ f i x e d ~ a t ~$ $k=e+r$. Hence representations of elements of $\tau^{\star}$ are fixed at length $k+2+k=2 k+2$. If $\tau$ is $a \operatorname{p,q}, b ; r-t y p e$, then $\tau$ is finite and $\tau^{\star}$ is order invariant.

LEMMA 4.4.6. The following is provable in $\mathrm{RCA}_{0}$. Let $p, q, b, n, r \geq 1$ and $\tau$ be a $p, q, b ; r-t y p e . ~ C o n d i t i o n s ~ 1)-4)$ are each equivalent to $\lambda\left(k, n, p+q+2, R_{1}, \ldots, R_{n-1}\right)$, for some order invariant relations $R_{1}, \ldots, R_{n-1} \subseteq \mathrm{~N}^{2 \mathrm{k}(\mathrm{p}+\mathrm{q}+2)}$ obtained explicitly from $p, q, b, n, r, \tau$.

Proof: We argue in $R C A_{0}$. Let $p, q, b, n, r \geq 1$ and $\tau$ be a p,q,b;r-type. It is clear that 3) is equivalent to 4), and hence by Lemma 4.4.5, 1)-4) are equivalent. We now exclusively use clause 4.
$B_{1} \subseteq \ldots \subseteq B_{n}$ asserts, for each $1 \leq i<n$, that $\left(\forall x \in B_{i}\right)(\exists y$ $\left.\in B_{i+1}\right)(\mathrm{x}=\mathrm{y})$.
"Distinct elements of $B_{n}$ represent distinct $p, q, r /(p+q)-$ terms" is of the form ( $\forall x, y \in B_{n}$ ) $(S(x, y))$.
"Distinct elements $t, t^{\prime}$ of the corresponding $T_{n}$ have $t=t^{\prime}$ $\notin \tau^{* \prime \prime}$ is of the form $\left(\forall x, y \in B_{n}\right)(S(x, y))$.

Clause 3ii for the corresponding $T_{1}$ is of the form ( $\forall \mathrm{x} \in$ $B_{1}$ ) (S (x)).

Clause 3iii for the corresponding T's is of the form ( $\forall i \in$ $[1, n))\left(\forall x_{1}, \ldots, x_{p} \in B_{i}\right)\left(\exists_{y_{1}}, \ldots, y_{q} \in B_{i+1}\right)\left(S\left(x_{1}, \ldots, x_{p}\right.\right.$, $\left.\mathrm{Y}_{1}, \ldots, \mathrm{Y}_{\mathrm{q}}\right)$ ).

Clause 3iv for the corresponding $T_{n}$ is of the form $\left(\forall \mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{q}+1} \in \mathrm{~B}_{\mathrm{n}}\right)\left(\mathrm{S}\left(\mathrm{x}_{1}, \ldots, \mathrm{x}_{\mathrm{q}+1}\right)\right)$.

Clause $3 v$ for the corresponding $\mathrm{T}_{\mathrm{n}}$ is of the form $\left(\forall x_{1}, \ldots, x_{p+1} \in B_{n}\right)\left(S\left(x_{p+1}\right) \rightarrow S^{\prime}\left(x_{1}, \ldots, x_{p+1}\right)\right)$.

Here all the $S^{\prime}$ s are order invariant relations. QED
LEMMA 4.4.7. There is a presentation of a primitive recursive function $H$ such that the following is provable in $A^{\prime}$. Let $p, q, b, n, r \geq 1$ and $\tau$ be a $p, q, b ; r-t y p e . ~ T h e n ~$ $H(p, q, b, r, n, \tau)=1$ if and only if $\tau$ is a $p, q, b ; r ; n-s p e c i a l$ type (as a Gödel number).

Proof: Let $p, q, b, r, n, \tau$ be given, where $\tau$ is a $p, q, b ; r-t y p e$. Apply Lemma 4.4.6 to obtain order invariant $R_{1}, \ldots, R_{n-1}$. Now apply Theorem 4.3.8. QED

We fix $H$ as given by Lemma 4.4.7.
LEMMA 4.4.8. Let $p, q, b, n \geq 1$. The following is provable in SMAH. ( $\exists r)(\forall \tau)(Q(p, q, b, r, \tau)=1 \rightarrow H(p, q, b, r, n, \tau)=1)$. Furthermore, this entire Lemma, starting with "Let p...", is provable in $\mathrm{RCA}_{0}$.

Proof: Let $\mathrm{p}, \mathrm{q}, \mathrm{b}, \mathrm{n}$ be as given. By Lemma 4.4.3, SMAH proves the existence of $r \geq 1$ such that every $p, q, b ; r-t y p e$ is a p, q, b;r;n-special type. Now apply Lemmas 4.4.4 and 4.4.7. QED

LEMMA 4.4.9. $\mathrm{RCA}_{0}+1$-Con(SMAH) proves $(\forall \mathrm{p}, \mathrm{q}, \mathrm{b}, \mathrm{n} \geq 1)$
$(\exists r)(\forall \tau)(Q(p, q, b, r, \tau)=1 \rightarrow H(p, q, b, r, n, \tau)=1)$.
Proof: We argue within $\mathrm{RCA}_{0}+1$-Con (SMAH). Let $\mathrm{p}, \mathrm{q}, \mathrm{b}, \mathrm{n} \geq 1$ be given. By Lemma 4.4.8,

1) $(\exists r)(\forall \tau)(Q(p, q, b, r, \tau)=1 \rightarrow H(p, q, b, r, n, \tau)=1)$
is provable in SMAH. Note that the quantifier $\forall \tau$ in 1) is bounded. Hence by 1 -Con (SMAH), this $\Sigma^{0}{ }_{1}$ sentence is true. QED

LEMMA 4.4.10. The following is provable in ACA' + 1Con (SMAH). ( $\forall p, q, b, n \geq 1$ ) ( $\exists r$ r) $(\forall \tau)(\tau$ is $a p, q, b ; r$-type $\rightarrow \tau$ is a p,q,b;r;n-special type).

Proof: By Lemmas 4.4.4, 4.4.7, and 4.4.9. QED
For Propositions C, D, see Appendix A.

THEOREM 4.4.11. Propositions A, B,C,D are provable in ACA' + 1-Con (SMAH).

Proof: Propositions A, C,D are immediate consequences of Proposition B over $\mathrm{RCA}_{0}$ (see Lemmas 4.2.1 and 5.1.1). We argue in ACA' +1 -Con (SMAH). Let $p, q, b, n \geq 1$, and $f \in$ ELG(p,b), $g \in E L G(q, b)$. Let $r$ be given by Lemma 4.4.10. By
 p, q,b;r-structure $M=\left(N, 0,1,<,+, f, g, C_{0}, C_{1}, \ldots\right)$. Let $\tau$ be its r-type. By Lemma 4.4.10, $\tau$ is a $\mathrm{p}, \mathrm{q}, \mathrm{b} ; \mathrm{n} ; \mathrm{r}$-special type.
 $\ldots \subseteq D_{n} \subseteq N$, where $D_{1} \subseteq\left\{C_{0}, C_{1}, \ldots\right\}$, and each $f D_{i} \subseteq D_{i+1} \cup$. $\mathrm{gD}_{\mathrm{i}+1}$, and $\mathrm{D}_{1} \cap \mathrm{fD}_{\mathrm{n}}=\varnothing$. This is Proposition B, thus concluding the proof. QED
