Bayesian regression

In this chapter we focus on a linear *DGP*

$$Y = X\beta + \varepsilon$$

uninformative priors for β , and known variance, $\sigma^2 = 1$. The posterior for β is Gaussian or normal with mean $b = (X^T X)^{-1} X^T y$ and variance $\sigma^2 (X^T X)^{-1}$

$$p(\beta | \sigma^2, Y, X) \propto \exp \left[-\frac{1}{2\sigma^2} (\beta - b)^T (X^T X) (\beta - b) \right]$$

Next, we return to the (*ANOVA* and *ANCOVA*) examples from the projections chapter but apply Bayesian simulation.

8.1 Mean estimation

As discussed in the classical linear models chapter, we can estimate an unknown mean from a Gaussian distribution via regression where $X = \iota$ (a vector of ones). The posterior distribution is Gaussian with mean \bar{Y} and variance $\frac{\sigma^2}{n}$. For an exchangeable sample, $Y = \{4, 6, 5\}$, we have $\bar{Y} = 5$ and variance $\frac{\sigma^2}{n} = 0.577$. The table below reports statistics from 1,000

posterior draws.

| statistic | $(\beta \mid \sigma^2, Y, X)$ |
|---------------------------------------------------|-------------------------------|
| mean | 4.99 |
| median | 4.99 |
| standard deviation | 0.579 |
| maximum | 6.83 |
| minimum | 3.25 |
| quantiles: | |
| 0.01 | 3.62 |
| 0.025 | 3.91 |
| 0.05 | 4.04 |
| 0.10 | 4.26 |
| 0.25 | 4.57 |
| 0.75 | 5.39 |
| 0.9 | 5.78 |
| 0.95 | 5.92 |
| 0.975 | 6.06 |
| 0.99 | 6.23 |
| Sample statistics for posterior draws of the mean | |
| $DGP : Y = X\beta + \varepsilon, \quad X = \iota$ | |

These results correspond well with, say, a 95% classical confidence interval $\{3.87, 6.13\}$ while the 95% Bayesian posterior interval is $\{3.91, 6.06\}$.

8.2 Different means (ANOVA)

8.2.1 ANOVA example 1

Suppose we have exchangeable outcome or response data (conditional on D) with two factor levels identified by D .

| | |
|-----|-----|
| Y | D |
| 4 | 0 |
| 6 | 0 |
| 5 | 0 |
| 11 | 1 |
| 9 | 1 |
| 10 | 1 |

We're interested in estimating the unknown means, or equivalently, the mean difference conditional on D (and one of the means). We view the former DGP as

$$\begin{aligned} Y &= X_1\beta^{(1)} + \varepsilon \\ &= \beta_0(1 - D) + \beta_1 D + \varepsilon \end{aligned}$$

a no intercept regression where $X_1 = [1 - D \ D]$ and $\beta^{(1)} = \begin{bmatrix} \beta_0 \\ \beta_1 \end{bmatrix}$, and the latter *DGP* as

$$\begin{aligned} Y &= X_2 \beta^{(2)} + \varepsilon \\ &= \beta_0 + \beta_2 D + \varepsilon \end{aligned}$$

where $X_2 = [\iota \ D]$, $\beta^{(2)} = \begin{bmatrix} \beta_0 \\ \beta_2 \end{bmatrix}$, and $\beta_2 = \beta_1 - \beta_0$.

The posterior for $\beta^{(1)}$ is Gaussian with means

$$b^{(1)} = [(\bar{Y} | D = 0) \ (\bar{Y} | D = 1)] = \begin{bmatrix} 5 \\ 10 \end{bmatrix}$$

and variance $\sigma^2 (X_1^T X_1)^{-1} = \begin{bmatrix} \frac{1}{3} & 0 \\ 0 & \frac{1}{3} \end{bmatrix}$.

$$p(\beta^{(1)} | \sigma^2, Y, X_1) \propto \exp \left[-\frac{1}{2\sigma^2} (\beta^{(1)} - b^{(1)})^T X_1^T X_1 (\beta^{(1)} - b^{(1)}) \right]$$

While the posterior for $\beta^{(2)}$ is Gaussian with means

$$b^{(2)} = [(\bar{Y} | D = 0) \ (\bar{Y} | D = 1) - (\bar{Y} | D = 0)] = \begin{bmatrix} 5 \\ 5 \end{bmatrix}$$

and variance $\sigma^2 (X_2^T X_2)^{-1} = \begin{bmatrix} \frac{1}{3} & -\frac{1}{3} \\ -\frac{1}{3} & \frac{2}{3} \end{bmatrix}$.

$$p(\beta^{(2)} | \sigma^2, Y, X_2) \propto \exp \left[-\frac{1}{2\sigma^2} (\beta^{(2)} - b^{(2)})^T X_2^T X_2 (\beta^{(2)} - b^{(2)}) \right]$$

The tables below report statistics from 1,000 posterior draws for each model.

| statistic | β_0 | β_1 | $\beta_1 - \beta_0$ |
|---------------------------------------------------------------------------|-----------|-----------|---------------------|
| mean | 4.99 | 10.00 | 5.00 |
| median | 4.99 | 10.00 | 4.99 |
| standard deviation | 0.597 | 0.575 | 0.851 |
| maximum | 6.87 | 11.63 | 7.75 |
| minimum | 2.92 | 8.35 | 2.45 |
| quantiles: | | | |
| 0.01 | 3.64 | 8.64 | 3.14 |
| 0.025 | 3.82 | 8.85 | 3.37 |
| 0.05 | 4.01 | 9.06 | 3.58 |
| 0.10 | 4.23 | 9.26 | 3.90 |
| 0.25 | 4.60 | 9.58 | 4.44 |
| 0.75 | 5.40 | 10.39 | 5.57 |
| 0.9 | 5.76 | 10.73 | 6.09 |
| 0.95 | 5.97 | 10.91 | 6.36 |
| 0.975 | 6.15 | 11.08 | 6.69 |
| 0.99 | 6.40 | 11.30 | 7.17 |
| classical 95% interval: | | | |
| lower | 3.87 | 8.87 | 3.40 |
| upper | 6.13 | 11.13 | 6.60 |
| Sample statistics for posterior draws from <i>ANOVA</i> example 1 | | | |
| $DGP : Y = X_1\beta^{(1)} + \varepsilon, \quad X_1 = [(1 - D) \quad D]$ | | | |

| statistic | β_0 | β_2 | $\beta_0 + \beta_2$ |
|-------------------------------------------------------------------------|-----------|-----------|---------------------|
| mean | 5.02 | 4.99 | 10.01 |
| median | 5.02 | 4.97 | 10.02 |
| standard deviation | 0.575 | 0.800 | 0.580 |
| maximum | 6.71 | 7.62 | 12.09 |
| minimum | 3.05 | 2.88 | 7.90 |
| quantiles: | | | |
| 0.01 | 3.65 | 3.10 | 8.76 |
| 0.025 | 3.89 | 3.43 | 8.88 |
| 0.05 | 4.05 | 3.66 | 9.02 |
| 0.10 | 4.29 | 3.91 | 9.22 |
| 0.25 | 4.62 | 4.49 | 9.62 |
| 0.75 | 5.41 | 5.51 | 10.38 |
| 0.9 | 5.73 | 6.02 | 10.75 |
| 0.95 | 5.93 | 6.30 | 10.96 |
| 0.975 | 6.14 | 6.54 | 11.18 |
| 0.99 | 6.36 | 6.79 | 11.33 |
| classical 95% interval: | | | |
| lower | 3.87 | 3.40 | 8.87 |
| upper | 6.13 | 6.60 | 11.13 |
| Sample statistics for posterior draws from ANOVA example 1 | | | |
| $DGP : Y = X_2\beta^{(2)} + \varepsilon, \quad X_2 = [\iota \quad D]$ | | | |

As expected, for both models there is strong correspondence between classical confidence intervals and the posterior intervals (reported at the 95% level).

8.2.2 ANOVA example 2

Suppose we now have a second binary factor, W .

| Y | D | W | $(D \times W)$ |
|-----|-----|-----|----------------|
| 4 | 0 | 0 | 0 |
| 6 | 0 | 1 | 0 |
| 5 | 0 | 0 | 0 |
| 11 | 1 | 1 | 1 |
| 9 | 1 | 0 | 0 |
| 10 | 1 | 0 | 0 |

We're still interested in estimating the mean differences conditional on D and W . The DGP is

$$\begin{aligned}
 Y &= X\beta + \varepsilon \\
 &= \beta_0 + \beta_1 D + \beta_2 W + \beta_3 (D \times W) + \varepsilon
 \end{aligned}$$

where $X = [\iota \ D \ W \ (D \times W)]$ and $\beta = \begin{bmatrix} \beta_0 \\ \beta_1 \\ \beta_2 \\ \beta_3 \end{bmatrix}$. The posterior is

Gaussian

$$p(\beta \mid \sigma^2, Y, X) \propto \exp \left[-\frac{1}{2\sigma^2} (\beta - b)^T X^T X (\beta - b) \right]$$

with mean

$$b = (X^T X)^{-1} X^T Y = \begin{bmatrix} 4.5 \\ 5 \\ 1.5 \\ 0 \end{bmatrix}$$

and variance $\sigma^2 (X^T X)^{-1} = \begin{bmatrix} \frac{1}{2} & -\frac{1}{2} & -\frac{1}{2} & \frac{1}{2} \\ -\frac{1}{2} & 1 & \frac{1}{2} & -1 \\ -\frac{1}{2} & \frac{1}{2} & \frac{3}{2} & -\frac{3}{2} \\ \frac{1}{2} & -1 & -\frac{3}{2} & 3 \end{bmatrix}$.

The tables below reports statistics from 1,000 posterior draws.

| | | | | |
|--------------------------------------------------------------------------|-----------|-----------|-----------|-----------|
| statistic | β_0 | β_1 | β_2 | β_3 |
| mean | 4.45 | 5.05 | 1.54 | -0.03 |
| median | 4.47 | 5.01 | 1.50 | -0.06 |
| standard deviation | 0.706 | 0.989 | 1.224 | 1.740 |
| maximum | 6.89 | 7.98 | 5.80 | 6.28 |
| minimum | 2.16 | 2.21 | -2.27 | -5.94 |
| quantiles: | | | | |
| 0.01 | 2.74 | 2.76 | -1.36 | -4.05 |
| 0.025 | 3.06 | 3.07 | -0.87 | -3.36 |
| 0.05 | 3.31 | 3.47 | -0.41 | -2.83 |
| 0.10 | 3.53 | 3.82 | -0.00 | -2.31 |
| 0.25 | 3.94 | 4.39 | 0.69 | -1.15 |
| 0.75 | 4.93 | 5.72 | 2.35 | 1.13 |
| 0.9 | 5.33 | 6.34 | 3.20 | 2.14 |
| 0.95 | 5.57 | 6.69 | 3.58 | 2.75 |
| 0.975 | 5.78 | 6.99 | 3.91 | 3.41 |
| 0.99 | 6.00 | 7.49 | 4.23 | 4.47 |
| classical 95% interval: | | | | |
| lower | 3.11 | 3.04 | -0.90 | -3.39 |
| upper | 5.89 | 6.96 | 3.90 | 3.39 |
| Sample statistics for posterior draws from ANOVA example 2 | | | | |
| $DGP : Y = X\beta + \varepsilon, \ X = [\iota \ D \ W \ (D \times W)]$ | | | | |

As expected, there is strong correspondence between the classical confidence intervals and the posterior intervals (reported at the 95% level).

8.2.3 ANOVA example 3

Now, suppose the second factor, W , is perturbed slightly.

| Y | D | W | $(D \times W)$ |
|-----|-----|-----|----------------|
| 4 | 0 | 0 | 0 |
| 6 | 0 | 0 | 0 |
| 5 | 0 | 1 | 0 |
| 11 | 1 | 1 | 1 |
| 9 | 1 | 0 | 0 |
| 10 | 1 | 0 | 0 |

We're still interested in estimating the mean differences conditional on D and W . The *DGP* is

$$\begin{aligned} Y &= X\beta + \varepsilon \\ &= \beta_0 + \beta_1 D + \beta_2 W + \beta_3 (D \times W) + \varepsilon \end{aligned}$$

where $X = [\iota \quad D \quad W \quad (D \times W)]$ and $\beta = \begin{bmatrix} \beta_0 \\ \beta_1 \\ \beta_2 \\ \beta_3 \end{bmatrix}$. The posterior is

Gaussian

$$p(\beta \mid \sigma^2, Y, X) \propto \exp \left[-\frac{1}{2\sigma^2} (\beta - b)^T X^T X (\beta - b) \right]$$

with mean

$$b = (X^T X)^{-1} X^T Y = \begin{bmatrix} 5 \\ 4.5 \\ 0 \\ 1.5 \end{bmatrix}$$

$$\text{and variance } \sigma^2 (X^T X)^{-1} = \begin{bmatrix} \frac{1}{2} & -\frac{1}{2} & -\frac{1}{2} & \frac{1}{2} \\ -\frac{1}{2} & 1 & \frac{1}{2} & -1 \\ -\frac{1}{2} & \frac{1}{2} & \frac{3}{2} & -\frac{3}{2} \\ \frac{1}{2} & -1 & -\frac{3}{2} & 3 \end{bmatrix}.$$

The tables below reports statistics from 1,000 posterior draws.

| | | | | |
|--------------------------------------------------------------------------------------------------------|-----------|-----------|-----------|-----------|
| statistic | β_0 | β_1 | β_2 | β_3 |
| mean | 5.01 | 4.49 | 0.01 | 1.50 |
| median | 5.00 | 4.49 | 0.03 | 1.52 |
| standard deviation | 0.700 | 0.969 | 1.224 | 1.699 |
| maximum | 7.51 | 7.45 | 3.91 | 8.35 |
| minimum | 2.97 | 1.61 | -5.23 | -3.34 |
| quantiles: | | | | |
| 0.01 | 3.46 | 2.28 | -2.84 | -2.36 |
| 0.025 | 3.73 | 2.67 | -2.30 | -1.82 |
| 0.05 | 3.87 | 2.93 | -1.98 | -1.18 |
| 0.10 | 4.08 | 3.25 | -1.56 | -0.62 |
| 0.25 | 4.50 | 3.79 | -0.80 | 0.37 |
| 0.75 | 5.50 | 5.14 | 0.82 | 2.60 |
| 0.9 | 5.93 | 5.76 | 1.51 | 3.61 |
| 0.95 | 6.11 | 6.09 | 2.00 | 4.23 |
| 0.975 | 6.29 | 6.27 | 2.36 | 4.74 |
| 0.99 | 6.51 | 6.58 | 2.93 | 5.72 |
| classical 95% interval: | | | | |
| lower | 3.61 | 2.54 | -2.40 | -1.89 |
| upper | 6.39 | 6.46 | 2.40 | 4.89 |
| Sample statistics for posterior draws from ANOVA example 3 | | | | |
| $DGP : Y = X\beta + \varepsilon, \quad X = \begin{bmatrix} \iota & D & W & (D \times W) \end{bmatrix}$ | | | | |

As expected, there is strong correspondence between the classical confidence intervals and the posterior intervals (reported at the 95% level).

8.2.4 ANOVA example 4

Now, suppose the second factor, W , is again perturbed.

| | | | |
|-----|-----|-----|----------------|
| Y | D | W | $(D \times W)$ |
| 4 | 0 | 0 | 0 |
| 6 | 0 | 1 | 0 |
| 5 | 0 | 1 | 0 |
| 11 | 1 | 0 | 0 |
| 9 | 1 | 0 | 0 |
| 10 | 1 | 1 | 1 |

We're again interested in estimating the mean differences conditional on D and W . The DGP is

$$\begin{aligned} Y &= X\beta + \varepsilon \\ &= \beta_0 + \beta_1 D + \beta_2 W + \beta_3 (D \times W) + \varepsilon \end{aligned}$$

where $X = [\iota \ D \ W \ (D \times W)]$ and $\beta = \begin{bmatrix} \beta_0 \\ \beta_1 \\ \beta_2 \\ \beta_3 \end{bmatrix}$. The posterior is Gaussian

$$p(\beta \mid \sigma^2, Y, X) \propto \exp \left[-\frac{1}{2\sigma^2} (\beta - b)^T X^T X (\beta - b) \right]$$

with mean

$$b = (X^T X)^{-1} X^T Y = \begin{bmatrix} 4 \\ 6 \\ 1.5 \\ -1.5 \end{bmatrix}$$

and variance $\sigma^2 (X^T X)^{-1} = \begin{bmatrix} 1 & -1 & -1 & 1 \\ -1 & 1.5 & 1 & -1.5 \\ -1 & 1 & 1.5 & -1.5 \\ 1 & -1.5 & -1.5 & 3 \end{bmatrix}$.

The tables below reports statistics from 1,000 posterior draws.

| | | | | |
|--------------------------------------------------------------------------|-----------|-----------|-----------|-----------|
| statistic | β_0 | β_1 | β_2 | β_3 |
| mean | 3.98 | 6.01 | 1.53 | -1.46 |
| median | 3.95 | 6.01 | 1.56 | -1.51 |
| standard deviation | 1.014 | 1.225 | 1.208 | 1.678 |
| maximum | 6.72 | 9.67 | 6.40 | 4.16 |
| minimum | 0.71 | 2.61 | -1.78 | -6.50 |
| quantiles: | | | | |
| 0.01 | 1.69 | 3.28 | -1.06 | -5.24 |
| 0.025 | 2.02 | 3.69 | -0.84 | -4.73 |
| 0.05 | 2.37 | 3.94 | -0.53 | -4.26 |
| 0.10 | 2.70 | 4.34 | -0.05 | -3.60 |
| 0.25 | 3.27 | 5.19 | 0.69 | -2.59 |
| 0.75 | 4.72 | 6.81 | 2.36 | -0.27 |
| 0.9 | 5.28 | 7.58 | 3.09 | 0.73 |
| 0.95 | 5.64 | 8.08 | 3.45 | 1.31 |
| 0.975 | 5.94 | 8.35 | 3.81 | 1.75 |
| 0.99 | 6.36 | 8.79 | 4.21 | 2.20 |
| classical 95% interval: | | | | |
| lower | 2.04 | 3.60 | -0.90 | -4.89 |
| upper | 5.96 | 8.40 | 3.90 | 1.89 |
| Sample statistics for posterior draws from ANOVA example 4 | | | | |
| $DGP : Y = X\beta + \varepsilon, \ X = [\iota \ D \ W \ (D \times W)]$ | | | | |

As expected, there is strong correspondence between the classical confidence intervals and the posterior intervals (reported at the 95% level).

8.3 Simple regression

Suppose we don't observe treatment, D , but rather observe only regressor, X_1 , in combination with outcome, Y .

| Y | X_1 |
|-----|-------|
| 4 | -1 |
| 6 | 1 |
| 5 | 0 |
| 11 | 1 |
| 9 | -1 |
| 10 | 0 |

For the perceived *DGP*

$$Y = \beta_0 + \beta_1 X_1 + \varepsilon$$

with $\varepsilon \sim N(0, \sigma^2 I)$ (σ^2 known) the posterior distribution for β is

$$p(\beta | Y, X) \propto \exp \left[-\frac{1}{2\sigma^2} (\beta - b)^T X^T X (\beta - b) \right]$$

where $X = \begin{bmatrix} 1 & X_1 \end{bmatrix}$, $b = (X^T X)^{-1} X^T Y = \begin{bmatrix} 7.5 \\ 1 \end{bmatrix}$, and $\sigma^2 (X^T X)^{-1} = \begin{bmatrix} \frac{1}{6} & 0 \\ 0 & \frac{1}{4} \end{bmatrix}$.

Sample statistics for 1,000 posterior draws are tabulated below.

| statistic | β_0 | β_1 |
|---------------------------------------------------------------------------------------|-----------|-----------|
| mean | 7.48 | 0.98 |
| median | 7.49 | 1.01 |
| standard deviation | 0.386 | 0.482 |
| maximum | 8.67 | 2.39 |
| minimum | 6.18 | -0.78 |
| quantiles: | | |
| 0.01 | 6.55 | -0.14 |
| 0.025 | 6.71 | 0.08 |
| 0.05 | 6.85 | 0.16 |
| 0.10 | 6.99 | 0.34 |
| 0.25 | 7.22 | 0.65 |
| 0.75 | 7.74 | 1.29 |
| 0.9 | 7.98 | 1.60 |
| 0.95 | 8.09 | 1.76 |
| 0.975 | 8.22 | 1.88 |
| 0.99 | 8.33 | 2.10 |
| classical 95% interval: | | |
| lower | 6.20 | 0.02 |
| upper | 7.80 | 1.98 |
| Sample statistics for posterior draws from <i>simple regression</i> example | | |
| $DGP : Y = X\beta + \varepsilon, \quad X = \begin{bmatrix} \iota & X_1 \end{bmatrix}$ | | |

Classical confidence intervals and Bayesian posterior intervals are similar, as expected.

8.4 ANCOVA example

Suppose in addition to the regressor, X_1 , we observe treatment, D , in combination with outcome, Y .

| Y | X_1 | D |
|-----|-------|-----|
| 4 | -1 | 0 |
| 6 | 1 | 0 |
| 5 | 0 | 0 |
| 11 | 1 | 1 |
| 9 | -1 | 1 |
| 10 | 0 | 1 |

For the perceived *DGP*

$$Y = \beta_0 + \beta_1 D + \beta_2 X_1 + \beta_3 (D \times X_1) + \varepsilon$$

with $\varepsilon \sim N(0, \sigma^2 I)$ (σ^2 known) the posterior distribution for β is

$$p(\beta | Y, X) \propto \exp \left[-\frac{1}{2\sigma^2} (\beta - b)^T X^T X (\beta - b) \right]$$

where $X = [\iota \quad D \quad X_1 \quad (D \times X_1)]$, $b = (X^T X)^{-1} X^T Y = \begin{bmatrix} 5 \\ 5 \\ 1 \\ 0 \end{bmatrix}$, and

$$\sigma^2 (X^T X)^{-1} = \begin{bmatrix} \frac{1}{3} & -\frac{1}{3} & 0 & 0 \\ -\frac{1}{3} & \frac{2}{3} & 0 & 0 \\ 0 & 0 & \frac{1}{2} & -\frac{1}{2} \\ 0 & 0 & -\frac{1}{2} & 1 \end{bmatrix}$$

Sample statistics for 1,000 posterior draws are tabulated below.

| statistic | β_0 | β_1 | β_2 | β_3 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|-----------|-----------|-----------|
| mean | 5.00 | 4.99 | 1.02 | 0.01 |
| median | 5.02 | 5.02 | 1.02 | 0.01 |
| standard deviation | 0.588 | 0.802 | 0.697 | 1.00 |
| maximum | 7.23 | 7.96 | 3.27 | 3.21 |
| minimum | 3.06 | 2.69 | -1.33 | -3.31 |
| quantiles: | | | | |
| 0.01 | 3.62 | 3.15 | -0.57 | -2.34 |
| 0.025 | 3.74 | 3.38 | -0.41 | -2.03 |
| 0.05 | 4.02 | 3.65 | -0.10 | -1.66 |
| 0.10 | 4.28 | 3.98 | 0.14 | -1.25 |
| 0.25 | 4.60 | 4.47 | 0.54 | -0.66 |
| 0.75 | 5.34 | 5.53 | 1.48 | 0.65 |
| 0.9 | 5.73 | 5.96 | 1.91 | 1.25 |
| 0.95 | 5.97 | 6.30 | 2.16 | 1.68 |
| 0.975 | 6.20 | 6.50 | 2.37 | 2.07 |
| 0.99 | 6.49 | 6.93 | 2.72 | 2.36 |
| classical 95% interval: | | | | |
| lower | 3.87 | 3.40 | -0.39 | -1.96 |

| Sample statistics for posterior draws from the <i>ANCOVA</i> example $DGP: Y = X\beta + \varepsilon, X = [\iota \quad D \quad X_1 \quad (D \times X_1)]$ | | | | |

Classical confidence intervals and Bayesian posterior intervals are similar, as expected.
